

1

ABSTRACT OF THE DISCLOSURE

2 A rivet structure includes a main body having a first end formed with
3 an enlarged head and a second end formed with an extended column. The main
4 body is provided with four opposite fixing plates each having a tapered face
5 and each having a bottom face. The bottom faces of the four fixing plates form
6 a square shaped configuration. Thus, the rivet structure can be combined with
7 an article rigidly and stably, thereby preventing the rivet structure from being
8 rotated relative to the article.
